

November 2010 Weather Summary

The dryness from October increased in November, from a number of cold fronts and a storm track that took most of the rain making energy north and east of South Central Texas. This left the west part of South Central very dry, while locations south and east of San Antonio and Austin picked up the most rain for the month, that was still less than normal for November. The dryness also helped increase extremes from warm to cold. Colder nights followed the cold fronts in a trend that began in late October; returned in early November; and increased in magnitude with colder nights in the mid to late part of November.

The charts below show the daily highs and lows for November 2010.
